Research Interests

I study social learning and cultural evolution in humans. My research intersects anthropology, archaeology, biology and psychology, and centres on the following areas:

- Human culture as a Darwinian evolutionary process
Exploring the parallels between genetic evolution and human cultural change, and developing a Darwinian theory of cultural evolution (Mesoudi, Whiten & Laland 2004; Mesoudi 2011, 2017). Consequently, using tools, methods, concepts and theories from evolutionary biology to study cultural change, and using the structure of evolutionary biology as a model framework that can serve to unify and integrate the social sciences (Mesoudi, Whiten & Laland 2006).
- The experimental study of human social learning
Using the methods of experimental psychology to uncover systematic biases in human social learning, i.e. the processes by which we acquire beliefs, skills and knowledge from other people. These include content-based biases that favour the transmission of certain kinds of information over others (e.g. social information: Mesoudi, Whiten & Dunbar 2006), and model-based biases that describe from whom people tend to learn from (e.g. successful people: Mesoudi & O'Brien 2008; Mesoudi 2008, 2011; prestigious people: Brand & Mesoudi 2019; Brand et al. 2020; Jiménez & Mesoudi 2020).
- Mathematical/agent-based models of cultural evolution
Using mathematical modelling methods from biology and agent-based computer simulation methods from sociology to explore the population-level consequences of small-scale social learning biases. Previous models have examined the co-evolution of mating systems and paternity beliefs (Mesoudi & Laland 2007), the cultural dynamics of copycat suicide (Mesoudi 2009), the degree to which popular culture can be described as random (Mesoudi & Lycett 2009), constraints on cumulative cultural evolution (Mesoudi 2011; Kempe et al. 2014), and how migration and acculturation shape between-group cultural variation (Mesoudi 2018).
